

Sabre Graphite Corp. Provides Update

23.09.2013 | [Marketwire](#)

CALGARY, ALBERTA -- (Marketwire - Sept. 23, 2013) - [Sabre Graphite Corp.](#) ("Sabre") (TSX VENTURE:SAG) is pleased to provide the following update. Sabre has completed its initial evaluation of the samples from its Burgess and Bedford graphite properties in Ontario. The company is very encouraged by these initial results and has begun planning the next stage of work.

Geochemical sampling at Sabre's 100% owned Burgess property in Southern Ontario has returned positive results, including high grade graphite mineralization in grab sampling from the West Zone graphite occurrence. Results are summarized in Table 1.

Sample	Location	Total Carbon %	Graphitic Carbon %	Host Rock
BR 15	Central Zone	0.34	0.31	Graphitic Shist
BR 16	Central Zone	10.9	0.55	Graphitic Orthogneiss
BR 18	Central Zone	11.8	0.26	Graphitic Marble
BR 23 A	East Zone	11.4	5.07	Graphitic Paragneiss
BR 23 C	East Zone	7.58	6.60	Graphitic Paragneiss
West Zone	West Zone	21.0	19.14	Graphitic Schist

The West Zone at-surface high grade graphite occurrence has also recently returned positive metallurgical test results. In 2010, a 750 kg composite bulk sample containing this material and material from the Bedford project produced a high purity, large flake graphite concentrate with suitable characteristics for both high-technology and industrial graphite applications. The identification by Sabre of very high grade material of up to 19% graphitic carbon in this area makes this target a priority for ongoing work at Burgess.

The Bedford and Burgess properties are located less than 15 kilometers apart and present opportunities for joint exploration and development. Both properties overlie significant flake graphite occurrences. A historical non-NI 43-101 compliant resource estimate completed in 2000 at the Bedford Property shows 2,602,800 tonnes of 3.44% to 3.52% C (graphite) Measured and Indicated, and 1,268,000 tonnes of 3.44% C (graphite) Inferred, which remains open to expansion. At the Burgess Property, nearly a century of exploration work has identified numerous zones of graphite mineralization, with the West Zone occurrence presenting excellent at-surface exposures of high-grade graphite mineralization.

Assay results are provided by Acme Labs of Vancouver, British Columbia, and are evaluated through a Quality Assurance and Quality Control (QAQC) procedure that includes the use of laboratory standards with known carbon values, and duplicated samples.

In addition the Company continues to evaluate other properties and opportunities, and with its current working capital position of approximately \$2,300,000, it is in a strong financial position to advance its current projects or any suitable projects that it is evaluating.

Chris Taylor, BSc, an independent consultant to the Company, is the qualified person as defined under National Instrument NI 43-10 and has reviewed and verified the metallurgical results referenced within this release.

Neither the TSX Venture Exchange nor its Regulation Services Provider (as that term is defined in the policies of the TSX Venture Exchange) accepts responsibility for the adequacy or accuracy of this release.
