

Global Atomic Announces Uranium Mineralization Continues to Grow Along Strike and Down Dip at DASA Project

15.08.2018 | [GlobeNewswire](#)

TORONTO, Aug. 15, 2018 - [Global Atomic Corp.](#) ("Global Atomic" or the "Company"), (TSX-V: GLO / OTCBB: SYIFF / Frankfurt: G12) is pleased to announce the following exploration update from its flagship DASA Project in the Republic of Niger, West Africa.

DASA Targeted Drill Areas (Looking East)

Highlights:

- Drilling at DASA along strike and down dip has been successful in confirming Global Atomic's geologic interpretation of the deposit and has identified five distinct areas of new mineralization.
- High grade mineralization was intersected at the Tegama Hill Main Zone, hole ASDH 577 returned 3,353 ppm eU₃O₈ over 69.8 metres, including 38,653 (3.9%) eU₃O₈ over 4.6 metres.
- Southwest Extension Zone 1 proved to have excellent mineralization in the Teloua formation, with hole ASDH 558 returning 19,933 (2.0%) eU₃O₈ over 9.5 metres, which included 54,101 (5.4%) eU₃O₈ over 3.3 metres. ASDH 574 returned 1,737 ppm U₃O₈ over 85.9 metres, including 5,597 ppm eU₃O₈ over 3.6 metres.

Stephen G. Roman, President and CEO, commented "Our geological model has proven correct with new high grade zones identified, which could have a substantial impact on the size of the DASA Deposit. Our next phase of drilling will focus on these extensions and a new resource will be calculated once Phase 2 drilling is completed. Currently, we continue to develop our Flank Zone area with CSA Global, with a PEA expected in September. The Flank Zone will be the target of initial operations in order to supply Orano Mining with mineralized material under the MOU signed in 2017" said Mr. Roman.

The following table summarizes latest drilling of the Tegama Hill extensions at DASA:

Zone	Hole	From (meters) ‐ To (meters)	Length (meters)	Grade (ppm/% eU ₃ O ₈)
Southwest Extension Zones 1 and 2	ASDH 556G	704.4 ‐ 752.2	47.8	1,806
	including	704.8 ‐ 706.2	1.4	13,511 (1.4%)

	including	368.0 – 369.0	1.0	2,455

** These are preliminary results based on gamma probing. Final results will be released once chemical assaying is completed at ALS Global in Vancouver, Canada. Terratec AG probed the holes using the Electromind DIL 1125 gamma probe and a Geiger Mueller probe UEP 1805 was used for high grades.*

Mr. George A. Flach, P.Geo., VP Exploration, commented “The strataform nature of this sandstone deposit shows many intersections of mineralization that can be seen in the accompanying table. The exciting discoveries we have made include high grades in all units within the Jurassic, Triassic and Carboniferous sandstone horizons.”

About Global Atomic

Global Atomic is a TSX Venture listed company providing a unique combination of high grade uranium development and cash flowing zinc concentrate production.

The Company’s Uranium Division includes six exploration permits in the Republic of Niger covering an area of approximately 750 km². Uranium mineralization has been identified on each of the permits, with the most significant discovery being the DASA deposit situated on the Adrar Emoles III concession, discovered in 2010 by Global Atomic geologists through grassroots field exploration.

Global Atomic’s Base Metals Division holds a 49% interest in Befesa Silvermet Turkey, S.L. (“BST”), which operates a processing facility located in Iskenderun, Turkey that converts Electric Arc Furnace Dust into a high-grade zinc oxide concentrate and sold to zinc smelters around the world. The Company’s joint venture partner, Befesa Zinc S.A.U. (“Befesa”), listed on the Frankfurt exchange under ‘BFSA’), holds a 51% interest in and is the operator of BST. Befesa is a market leader in EAFD recycling, capturing approximately 50% of the European EAFD market with facilities located throughout Europe and Korea.
