Clean Commodities Corp. Option Partner Announces VTEM Survey at East Preston Uranium Project

11.12.2018 | CNW

VANCOUVER, Dec. 11, 2018 /CNW/ - Clean Commodities Corp. (TSX VENTURE: CLE) ("Clean Commodities" or the "Corporation") announces that its option partner, Azincourt Energy Corp. ("Azincourt"), has provided an update regardi work program at the East Preston Uranium Project ("East Preston") located in the southwestern Athabasca Basin, Sask

East Preston Uranium Project Map:

Azincourt has engaged Geotech Ltd. to conduct a helicopter-borne Versatile Time-Domain Electromagnetic (VTEM&#8 and Magnetic survey over the southeastern portion of the East Preston Project to complete survey coverage over the e project area.

The planned survey will consist of 498 line-km with 300m line spacing and 1,000m tie-line spacing – identical pa to the previous VTEM™ Max survey, and ties directly into the previous flight lines. Flight lines are oriented NW-S perpendicular to the NE-SW trending structural and conductor trends of the basement rocks at East Preston.

Geotech Ltd., the sole provider of the VTEM™ Max platform, has a system currently active in Saskatchewan and commence the East Preston survey in mid-December. Weather permitting, the survey is expected to require 5-7 days a completed by year-end.

Azincourt has applied for drill permits at East Preston and upon receipt is planning an approximate 10+ hole, 2000-250 diamond drill program of inclined drill holes to test the structurally-controlled basement uranium deposit model. Drill targ been prioritized based on stacking of airborne and ground electromagnetic and ground gravity geophysical data interpr

Historical Work

Azincourt is currently earning towards a 70% interest in the 25,000+ hectare East Preston project as part of an option a with Clean Commodities Corp. and Skyharbour Resources Ltd. ("Skyharbor"). Extensive regional exploration work at E was completed in 2013-14, including airborne electromagnetic (VTEM), magnetic and radiometric surveys. Three prosp conductive, low magnetic signature corridors have been discovered on the property. The three distinct corridors have a length of over 25 km, each with multiple EM conductor trends identified. Ground prospecting and sampling work comple have identified outcrop, soil, biogeochemical and radon anomalies, which are key pathfinder elements for unconformity deposit discovery.

Only one of the corridors has been drill tested to-date, successfully intersecting structurally disrupted graphitic metased rocks and anomalous pathfinder elements (including uranium) at the Swoosh S6 target using a combination of Horizont (HLEM) and gravity as primary targeting tools.

Azincourt Geophysical Work - Winter 2018

Azincourt completed a winter geophysical exploration program in January-February 2018 that generated a significant a new drill targets within the previously untested corridors while refining additional targets near the previous drilling along Swoosh corridor.

The work included 51.5 km of grid preparation (line cutting/picketing), 46.1 km of horizontal loop electromagnetic (HLEM

40.6 km of ground gravity along the previously known airborne helicopter VTEM conductive trends.

Ground-truthing work confirmed the airborne conductive trends and more accurately located the conductor axes for futu testing. The gravity survey identified areas along the conductors with a gravity low signature, which is often associated alteration, fault/structural disruption and potentially, uranium mineralization. The combination/stacking of positive featur assist prioritizing targets for testing first.

The Main Grid shows multiple long linear conductors with flexural changes in orientation and offsets breaks in the vicini interpreted fault lineaments – classic targets for basement-hosted unconformity uranium deposits. These are no simple basement conductors; they are clearly upgraded/enhanced prospectivity targets because of the structural compl

Targets

The targets are basement-hosted unconformity related uranium deposits similar to NexGen's Arrow deposit and Camec Point mine. East Preston is near the southern edge of the western Athabasca Basin, where targets are in a near-surfac environment without Athabasca sandstone cover – therefore they are relatively shallow targets but can have gre extent when discovered. The project ground is located along a parallel conductive trend between the PLS-Arrow trend a Cameco's Centennial deposit (Virgin River-Dufferin Lake trend).

Qualified Person

The technical information in this news release has been prepared in accordance with the Canadian regulatory requirem out in National Instrument 43-101 and reviewed and approved by Richard Kusmirski, P.Geo., M.Sc., Skyharbour's Hea Advisor and a Qualified Person.

About Clean Commodities Corp.

Clean Commodities Corp. (TSXV:CLE) is an exploration company involved in a diverse portfolio of clean commodity as including lithium and uranium projects. For more information, please visit www.cleancommodities.com.
