

Labrador Gold Appoints Mr. Matthieu Lapointe Vice President Exploration

01.10.2020 | [GlobeNewswire](#)

TORONTO, Oct. 01, 2020 - [Labrador Gold Corp.](#) (TSX.V:LAB | OTCQX:NKOSF | FNR: 2N6) (“LabGold” or the “Company”) is pleased to announce the appointment of Matthieu (Matt) Lapointe as VP Exploration effective immediately.

Mr. Lapointe, P.Geo. has over 15 years of greenfield and brownfield precious metal exploration throughout Canada and internationally. Most recently Mr. Lapointe was Chief Geologist for TMAC Resources where he developed exploration strategy and managed regional exploration of the 1,600 km² Hope Bay Project in Nunavut including brownfield targeting at the active Doris gold mine and two advanced stage gold deposits.

“I am very pleased to welcome Matt to the LabGold technical team,” said Roger Moss, President and CEO of the Company. “He is a seasoned explorationist well versed in evaluating large land packages and advancing projects from grassroots to production stages. I expect him to have an immediate impact on our exploration program at Kingsway, especially as we gear up for our fall drilling campaign.”

Matt Lapointe commented, “I am pleased to join the LabGold team as the company begins the next phases of exploration. LabGold has assembled an impressive property portfolio and have been systematically exploring highly prospective areas. The progress and results to date are encouraging and I look forward to continue advancing these exciting projects.”

Roger Moss, PhD., P.Geo., is the qualified person responsible for all technical information in this release.

About Labrador Gold

Labrador Gold is a Canadian based mineral exploration company focused on the acquisition and exploration of prospective gold projects in Eastern Canada.

In early March 2020, Labrador Gold acquired the option to earn a 100% interest in the Kingsway project in the Gander area of Newfoundland. The property is along strike to the northeast of New Found Gold’s discovery of 92.86 g/t Au over 19.0 metres on their Queensway property. (Note that mineralization hosted on adjacent or nearby properties is not necessarily indicative of mineralization hosted on the Company’s property). In early July 2020, the Company signed an option agreement to acquire a third license to add to the property package which now covers approximately 77 km². The three licenses comprising the Kingsway project cover approximately 16km of the Appleton fault zone which is associated with gold occurrences in the region, including the New Found Gold discovery. Historical work over the area covered by the Kingsway licenses shows evidence of gold in till, vegetation, soil, stream sediments, lake sediments and float. Infrastructure in the area is excellent located just 18km from the town of Gander with road access to the project, nearby electricity and abundant local water.

The Hopedale property covers much of the Hunt River and Florence Lake greenstone belts that stretch over 80 km. The belts are typical of greenstone belts around the world but have been underexplored by comparison. Initial work by Labrador Gold during 2017 show gold anomalies in soils and lake sediments over a 3 kilometre section of the northern portion of the Florence Lake greenstone belt in the vicinity of the known Thurber Dog gold showing where grab samples assayed up to 7.8g/t gold. In addition, anomalous gold in soil and lake sediment samples occur over approximately 40 kilometres along the southern section of the greenstone belt (see news release dated January 25th 2018 for more details). Labrador Gold now controls approximately 57km strike length of the Florence Lake Greenstone Belt.

The Ashuanipi gold project is located just 35 km from the historical iron ore mining community of

Schefferville, which is linked by rail to the port of Sept Iles, Quebec in the south. The claim blocks cover large lake sediment gold anomalies that, with the exception of local prospecting, have not seen a systematic modern day exploration program. Results of the 2017 reconnaissance exploration program following up the lake sediment anomalies show gold anomalies in soils and lake sediments over a 15 kilometre long by 2 to 6 kilometre wide north-south trend and over a 14 kilometre long by 2 to 4 kilometre wide east-west trend. The anomalies appear to be broadly associated with magnetic highs and do not show any correlation with specific rock types on a regional scale (see news release dated January 18th 2018). This suggests a possible structural control on the localization of the gold anomalies. Historical work 30 km north on the Quebec side led to gold intersections of up to 2.23 grams per tonne (g/t) Au over 19.55 metres (not true width) (Source: IOS Services Geoscientifiques, 2012, Exploration and geological reconnaissance work in the Goodwood River Area, Sheffor Project, Summer Field Season 2011). Gold in both areas appears to be associated with similar rock types.

The Company has 93,294,175 common shares issued and outstanding and trades on the TSX Venture Exchange under the symbol LAB.
