

CanaGold Resources Ltd. Continues to Intersect High-Grade Gold Mineralization in C-West Main Vein

21.04.2022 | [Accesswire](#)

Including 42.5 gpt Au over 2 m at New Polaris Project, BC

VANCOUVER, April 21, 2022 - [CanaGold Resources Ltd.](#) (TSX:CCM), (OTCQB:CRCUF), (FSE:CANA) announces high-grade gold assays for six more drill holes from the expanded drill program at its 100% owned New Polaris Gold project located in northwestern British Columbia, 100 kilometers (km) south of Atlin and 60 km northeast of Juneau, Alaska.

The assay results include samples from drill holes that have returned significant intercepts of gold mineralization in the C-West Main ("CWM").

Highlights:

- 42.5 grams per tonne ("gpt") gold ("Au") over 2.0 metres ("m") from 466.1 m in Hole 22-1665E1
 - Including 69.7 gpt Au over 0.8 m from 466.6 m
- 19.3 gpt Au over 4.3 m from 410.5 m down the hole, in Hole 21-1675E1A
 - Including 33.2 gpt Au over 1.0 m from 411.0 m
- 10.4 gpt Au over 5.8 m from 460.5 m in Hole 21-1755E1
- 10.5 gpt Au over 4.9 m from 268.8 m in Hole 21-1800E4
- 12.9 gpt Au over 3.6 m from 408.5 m in Hole 22-1692E1
- 9.43 gpt Au over 1.7 m from 469.9 m in Hole 22-1700E1

Scott Eldridge, Canagold CEO, said, "In addition to significant infill results, this most recent batch of assays has intercepted robust mineralization within known gaps in the resource model. We see multiple opportunities for resource expansion in parallel veins as well as expanding the C West Main Vein where a known gap area has now intercepted 42.5 grams over 2 metres.

We are seeing excellent continuity in our infill efforts as we move towards upgrading inferred resources to measured and indicated. The tighter drill spacings are delivering significant grade over widths that support the PEA mine plan. We anticipate additional results in the coming weeks."

Detailed information for the six drill holes and the sample assay results and mineralized intercepts are provided in Table 1 and Table 2 below.

All of the planned 47-holes of the originally proposed 24,000 m infill drill program were completed by the end of 2021 and assay results have now been received for 43 holes. An additional 6,000 meters of drilling in 7 holes were completed in January and February 2022. The samples collected from the mineralized zone in all of those holes have been submitted to the ALS Geochemistry lab in Whitehorse, YT for gold analysis. Results from the remaining holes will be released as they are received in the coming weeks. Drilling has now been completed for the season prior to the spring thaw. Drilling equipment is being stored on site ready for the start of the next drilling campaign in the summer of 2022.

Infill Holes to Upgrade Inferred Resources to Indicated Resources

The current drill program is designed primarily to in-fill drill the Inferred Resources of the CWM vein system

within the currently defined resources in the PEA*. The infill drill holes range in depth from 300 to 650 m and are designed to provide greater density of drill intercepts (20 - 25 m spacing) in areas of Inferred Resources between 150 and 600 m below surface. The improved drill density will be used to upgrade parts of the Inferred Resources to Indicated Resources for inclusion in a future feasibility study.

*The New Polaris resource is contained within a preliminary economic assessment ("PEA") report which was prepared by Moose Mountain Technical Services in the format prescribed by NI43-101 Standards of Disclosure for Mineral Projects, and filed on Sedar April 18, 2019.

New Polaris Overview

Canagold's flagship asset is the 100% owned New Polaris Gold Mine project located in northwestern British Columbia about 100 kilometers south of Atlin, BC and 60 kilometers northeast of Juneau, Alaska. The property consists of 61 contiguous Crown-granted mineral claims and one modified grid claim covering 850 hectares. New Polaris lies within the Taku River Tlingit First Nations traditional territory. Canagold is committed to providing employment and business opportunities that help support the local economies in the vicinity of its exploration projects.

The New Polaris gold deposit is an early Tertiary, mesothermal gold-bearing vein system occupying shear zones cross-cutting late Paleozoic andesitic volcanic rocks. It was mined by underground methods from 1938 to 1942, and again from 1946 to early 1951, producing approximately 245,000 oz gold from 740,000 tonnes of ore at an average grade of 10.3 gpt gold. Three main veins ("AB, C and Y") were mined to a maximum depth of 150 m and have been traced by drilling for up to 1,000 m along strike and up to 800 m down dip, still open for expansion. The gold occurs dominantly in finely disseminated arsenopyrite within quartz-carbonate stock-work veins and altered wall-rocks. Individual mineralized zones extend up to 250 meters in length and 14 meters in width. Average widths more commonly range from 2 to 5 meters.

Qualified Person

Garry Biles, P.Eng, President & COO for [CanaGold Resources Ltd.](https://www.canagoldresources.com/), is the Qualified Person who reviewed and approved the contents of this news release.

Drill Core Sampling and Quality Assurance - Quality Control Program

Drill core is geologically logged to identify the gold mineralized zones that are allocated unique sample number tickets and marked for cutting using a purpose-built diamond blade rock saw. Half core samples are collected in labelled bags and the other half remains in the original core box stored on site. Quality control (QC) samples including certified reference material standards, blanks and duplicates are inserted into the sample sequence at intervals of one in ten on a rotating basis to monitor laboratory performance and provide quality assurance (QA) of the assay results. Several sample bags are transported together in rice bags with unique numbered security tags attached and labelled with Company and lab contact information to ensure sample security and chain of custody during shipment to the lab.

The samples are submitted to the ALS Geochemistry lab in Whitehorse, YT for preparation and assaying. The entire sample is crushed to 70% passing -2 millimeters and a 250 gram aliquot is split and pulverized to 85% passing -75 microns. Analysis for gold is by 30 gram fire assay and gravimetric finish. A suite of 30 other elements including arsenic, antimony, sulfur and iron are analyzed by aqua-regia digestion Inductively Coupled Plasma Atomic Emission Spectroscopy (ICP-AES). ALS Canada Ltd. is accredited by the Standards Council of Canada and is an ISO/IEC 9001:2015 and 17025:2017 certified analytical laboratory in North America.

Cautionary Note Regarding Forward-Looking Statements

This news release contains "forward-looking statements" within the meaning of the United States private securities litigation reform act of 1995 and "forward-looking information" within the meaning of applicable Canadian securities legislation. Statements contained in this news release that are not historical facts are forward-looking information that involves known and unknown risks and uncertainties. Forward-looking statements in this news release include, but are not limited to, statements with respect to the future performance of Canagold, and the Company's plans and exploration programs for its mineral properties, including the timing of such plans and programs. In certain cases, forward-looking statements can be identified by the use of words such as "plans", "has proven", "expects" or "does not expect", "is expected", "potential", "appears", "budget", "scheduled", "estimates", "forecasts", "at least", "intends", "anticipates" or "does not anticipate", or "believes", or variations of such words and phrases or state that certain actions, events or results "may", "could", "would", "should", "might" or "will be taken", "occur" or "be achieved".

Forward-looking statements involve known and unknown risks, uncertainties and other factors which may cause the actual results, performance or achievements of the Company to be materially different from any future results, performance or achievements expressed or implied by the forward-looking statements. Such risks and other factors include, among others risks related to the uncertainties inherent in the estimation of mineral resources; commodity prices; changes in general economic conditions; market sentiment; currency exchange rates; the Company's ability to continue as a going concern; the Company's ability to raise funds through equity financings; risks inherent in mineral exploration; risks related to operations in foreign countries; future prices of metals; failure of equipment or processes to operate as anticipated; accidents, labor disputes and other risks of the mining industry; delays in obtaining governmental approvals; government regulation of mining operations; environmental risks; title disputes or claims; limitations on insurance coverage and the timing and possible outcome of litigation. Although the Company has attempted to identify important factors that could affect the Company and may cause actual actions, events or results to differ materially from those described in forward-looking statements, there may be other factors that cause actions, events or results not to be as anticipated, estimated or intended. There can be no assurance that forward-looking statements will prove to be accurate, as actual results and future events could differ materially from those anticipated in such statements. Accordingly, do not place undue reliance on forward-looking statements. All statements are made as of the date of this news release and the Company is under no obligation to update or alter any forward-looking statements except as required under applicable securities laws.
